

SHAREWARE FOR VIDEO AND MOTION GRAPHICS

top:
Snapz Pro is the author's favorite screen capture utility for Macs.

middle:
Cinematize extracts non-copy-protected material from DVDs—a lifesaver when that's the only place your source files can be found.

bottom:
BbDEMUX is simple enough to use (not to mention tasty). It demultiplexes MPEG files so video and audio can be handled separately.

1280 x 1024 while we worked. It managed to capture 30 fps for a 3-hour taping session. It took 8 hours to process after capturing, but we ended up with a beautifully clean Animation Codec file that allowed us to scale down for full-screen views and crop for close-up shots for the computer training DVD. This product has fundamentally changed the way training videos and interface shots are captured on a computer: It eliminates the need for a high-end scan converter for most users.

■ CONVERTER TOOLS

Got this, but need to make it that? These tools will let you convert between digital formats to get you to the file type you need. On a related note, I'll tackle Final Cut Pro-Avid interchange as well, and find another way to help these two apps get along more nicely.

■ BBDEMUX

Free [Mac]

<http://sourceforge.net/projects/macbbdemux>

I stumbled across this great piece of freeware when stuck on an editing problem. My clients had some

MPEG-1 files they wanted to edit together for their Web site. I was able to import them into my NLE and set the timeline to 320 x 240, but I couldn't get the audio to import. With MPEG-1 files, the audio and video are merged into one track (muxed). This great little app does nothing more than split them apart, but that's all that was needed—and it's free.

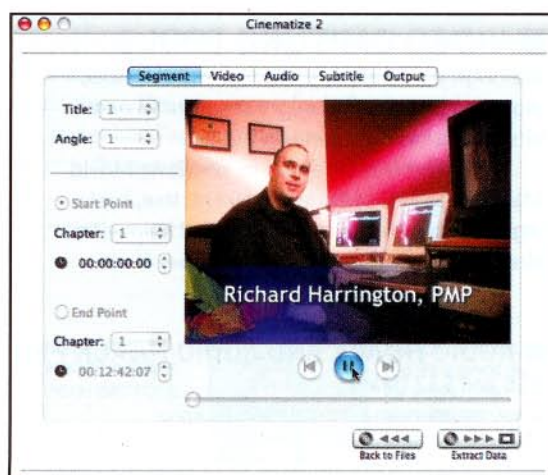

■ CINEMATIZE

\$60 [Mac and PC]

www.miraizon.com

We often get DVDs from clients who own video files (we're talking about productions they paid for, not the latest Brad Pitt flick). When we ask for a beta or DVCAM master, they look confused and panicked. It's certainly best to go back to a master tape to rework video, but you may not have the time or means on every job. DV covered a lot of these tools in Douglas Dixon's article "Deconstructing DVDs: Re-Editing Your DVDs" (Nov. '04 DV), so check that out for more tools and techniques to work with DVD video as a source.

My favorite app is Cinematize, a cross-platform tool designed to extract non-copy-protected material from a DVD. This can also come in handy if the deck just ate your dub master and you have to get a copy out. Although you'll be dealing with a compressed file, it's better than no file at all.

If you find yourself pleased by the tasty demuxing goodness found herein, please consider making a donation using the links to the right.
